

VGP351 – Week 8

⇒ Agenda:

- Procedural texturing and modeling
 - Rationale
 - Basic techniques / examples
 - Noise
- Anti-aliasing

5-March-2009

© Copyright Ian D. Romanick 2008

Procedural Graphics

- Generation of textures, models, or animation from *code* instead of *data*
 - Creation may happen at rendering-time *or* at application load-time

5-March-2009

© Copyright Ian D. Romanick 2008

Procedural Graphics

⇒ Why?

- Less space!
- Easier to add “random” variation
- May be easier to describe than to draw
 - L-systems for trees
 - Fractals for whole worlds
 - etc.

5-March-2009

© Copyright Ian D. Romanick 2008

Procedural Graphics

- Example: “Debris” by Farbrausch
 - Entire demo is 181,248 bytes
 - This JPEG image is 166,059 bytes!

- See <http://scene.org/file.php?id=373930> or http://www.youtube.com/watch?v=wqu_IpkOYBg&fmt=22

5-March-2009

© Copyright Ian D. Romanick 2008

Brick Shader

- Given some parameters, generate an image that looks like bricks

5-March-2009

© Copyright Ian D. Romanick 2008

Brick Shader

- Given some parameters, generate an image that looks like bricks
 - Divide *shader-space* into cells
 - Each cell is conceptually a 1×1 unit

5-March-2009

© Copyright Ian D. Romanick 2008

Brick Shader

⇒ Bottom row is easy:

- If s is less than $\text{brick_width} / (\text{brick_width} + \text{mortar_width})$, the color is brick

5-March-2009

© Copyright Ian D. Romanick 2008

Brick Shader

- ⇒ Top row is the bottom row with an offset
 - If t is greater than $\text{brick_height} / (\text{brick_height} + \text{mortar_height})$, add 0.5 to s

5-March-2009

© Copyright Ian D. Romanick 2008

Toy Ball

- ⇒ Texture consists of a complex shape
 - Can't use simple compares to determine which region a point is in
 - All of the boundaries are straight lines

5-March-2009

© Copyright Ian D. Romanick 2008

Toy Ball

- Divide shader space into regions called *half spaces*

5-March-2009

© Copyright Ian D. Romanick 2008

Toy Ball

- ⇒ If we draw a line through 2D space, how do we determine which side of that line a point is on?

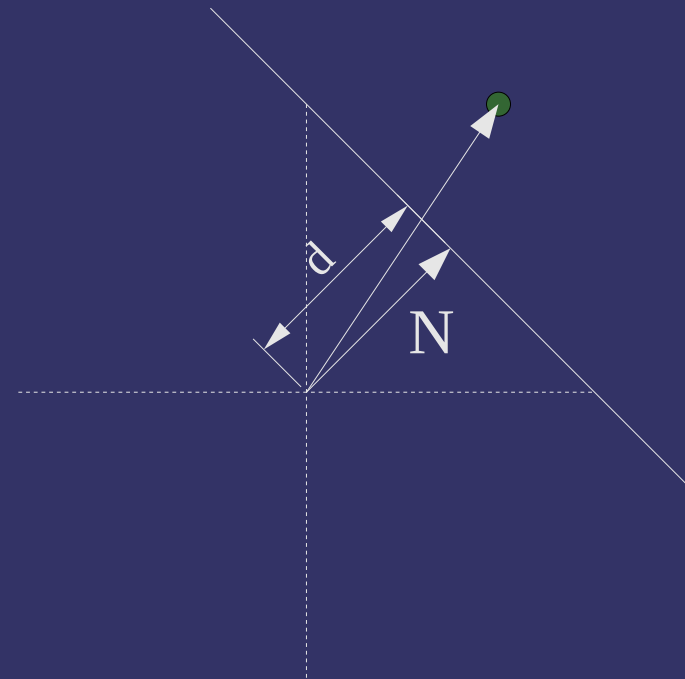

5-March-2009

© Copyright Ian D. Romanick 2008

Toy Ball

- If we draw a line through 2D space, how do we determine which side of that line a point is on?
 - Use the parametric definition of a line
 - Use x and y from the point
 - If the result is less than 0, the point is “inside”
 - If the result is equal to 0, the point is on the line
 - If the result is greater than 0, the point is “outside”

$$0 = Ax + By - d$$

5-March-2009

© Copyright Ian D. Romanick 2008

Toy Ball

⇒ What does this look like?

$$Ax + By - d$$

5-March-2009

© Copyright Ian D. Romanick 2008

Toy Ball

⇒ What does this look like?

$$Ax + By - d$$

⇒ Our friend, the dot-product:

$$[A \quad B \quad -d] \cdot [x \quad y \quad 1]$$

5-March-2009

© Copyright Ian D. Romanick 2008

Toy Ball

- We want a binary answer whether the point is inside or outside

```
dist = dot(p, half_space);  
in_or_out = (dist < 0.0) ? 0.0 : 1.0;
```

- A more succinct way in GLSL uses the `step` function:

```
dist = dot(p, half_space);  
in_or_out = step(0.0, dist);
```

5-March-2009

© Copyright Ian D. Romanick 2008

Toy Ball

- We want a binary answer whether the point is inside or outside of all 5 half-spaces

```
dist.x = dot(p, half_space0);  
dist.y = dot(p, half_space1);  
dist.z = dot(p, half_space2);  
dist.w = dot(p, half_space3);
```

```
dist.x = step(dot(dist, vec4(1.0))) +  
          step(0.0, dot(p, half_space4));
```

```
in_or_out = dist.x > 4.0;  
color = mix(ball_color, star_color, in_or_out);
```

Wang Tiles

- Goal: we want to create an infinite, non-repeating texture for things like grass, sand, etc.

5-March-2009

© Copyright Ian D. Romanick 2008

Wang Tiles

- Goal: we want to create an infinite, non-repeating texture for things like grass, sand, etc.
 - Even a 2048x2048 texture will show tiling artifacts
 - *And* it will use 16MB of texture memory...yuck!

5-March-2009

© Copyright Ian D. Romanick 2008

Wang Tiles

- ⇒ Goal: we want to create an infinite, non-repeating texture for things like grass, sand, etc.
 - Even a 2048x2048 texture will show tiling artifacts
 - *And* it will use 16MB of texture memory...yuck!
- ⇒ Create a “mosaic” from small a few small “tiles”

5-March-2009

© Copyright Ian D. Romanick 2008

Wang Tiles

- Goal: we want to create an infinite, non-repeating texture for things like grass, sand, etc.
 - Even a 2048x2048 texture will show tiling artifacts
 - *And* it will use 16MB of texture memory...yuck!
- Create a “mosaic” from small a few small “tiles”
 - If the tile selection is pseudo-random, as few as 32 tiles can have a *very* large repeat period
 - Unlike mosaic tiles, texture tiles have to match at the edges
 - Either all tiles edges have to match or the selection algorithm has to pick a tile that will match edges with its neighbors

5-March-2009

© Copyright Ian D. Romanick 2008

Wang Tiles – Edge Coloring

- ⇒ Name the four tile edges N , E , S , W
 - The N/S edges can have one of K_v edge “colors”
 - The E/W edges can have one of K_h edge “colors”
 - A tile with an N edge of color X must be south of a tile with an S edge of color X
 - A tile with each possible combination of edge colors must exist
 - There must be at least $K_v^2 \times K_h^2$ tiles

5-March-2009

© Copyright Ian D. Romanick 2008

Wang Tiles – Tile Arrangement

- Assuming we have a set of tiles...
 - Generating tiles from a sample source image is a larger topic than we have time for
- Arrange tiles in a $K_v^2 \times K_h^2$ pattern in texture atlas
 - Neighboring tiles must obey edge coloring rules...even neighbors across border edges!

5-March-2009

© Copyright Ian D. Romanick 2008

Wang Tiles – Tile Arrangement

- Given a pair of edge colors, the following placement algorithm is use:

$$\text{Index}(e_1, e_2) = \begin{cases} 0 & \text{if } e_1 = e_2 = 0 \\ e_1^2 + 2e_2 - 1 & \text{if } e_1 > e_2 > 0 \\ e_2^2 + 2e_1 & \text{if } e_2 > e_1 \geq 0 \\ (e_2 + 1)^2 - 2 & \text{if } e_1 = e_2 > 0 \\ (e_1 + 1)^2 - 1 & \text{if } e_1 > e_2 = 0 \end{cases}$$

5-March-2009

© Copyright Ian D. Romanick 2008

Wang Tiles – Tile Selection

➤ Given texture coordinate (s, t) :

– Calculate tile index

– $O_h = t / T_h$

– $O_v = s / T_v$

– Hash tile index to calculate edge colors

– $C_s = H(H(O_h) + O_v) \% K_v$

– $C_n = H(H(O_h) + O_v + 1) \% K_v$

– $C_w = H(O_h + H(O_v * 2)) \% K_h$

– $C_e = H(O_h + 1 + H(O_v * 2)) \% K_h$

– Notice that $C_e(x, y) = C_w(x + 1, y)$

– Convert edge colors to row / column indexes

5 March 2009

© Copyright Ian D. Romanick 2008

Wang Tiles – Tile Selection

- Given texture coordinate (s, t) :
 - Calculate row / column position in texture
 - $t_{base} = I_h * T_h$
 - $s_{base} = I_v * T_v$
 - Calculate texel offset within tile
 - $t_{offset} = t \% T_h$
 - $s_{offset} = s \% T_v$
 - Sample the texture!
 - Final coordinate is $(s_{base} + s_{offset}, t_{base} + t_{offset})$

5-March-2009

© Copyright Ian D. Romanick 2008

Wang Tiles – Hash Function

- ⇒ Implement as a permutation table
 - Use a texture rectangle that is 1 texel tall
 - Use roughly 4x entries in table as possible edge colors
 - More recent hardware can use uniform arrays
 - Geforce 6 or Radeon X800

5-March-2009

© Copyright Ian D. Romanick 2008

Wang Tiles – Filtering Gotchas

- ⇒ Mipmap filtering can be a problem...
 - The 1x1 level blends all of the tiles together...bad!!!
 - Need to clamp the minimum LOD to the level lowest level that doesn't blur across tile boundaries
 - This is *much* easier with texture arrays

5-March-2009

Crater Shader

⇒ Two parts to this shader

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader

- Two parts to this shader
 - Height / normal
 - Color

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader

- Two parts to this shader
 - Height / normal
 - Color
 - Attack each separately, then try to unify

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Height

- ⇒ Craters are generally circular
 - Height varies with distance from center

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Height

- ⇒ Craters are generally circular
 - Height varies with distance from center
 - Associate a height with each distance where there is a change

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Height

- Select an interpolation scheme between each region
 - R_0 to R_1 and R_1 to R_2 could be linear, R_2 to R_3 and R_3 to R_4 could be exponential, etc.

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Height

⇒ In shader:

- Determine fragment distance from center
`r = length(position - center);`

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Height

⇒ In shader:

- Determine fragment distance from center

```
r = length(position - center);
```

- Determine which region contains the fragment

```
if (r < crater_param[1].x) {  
    ...  
} else if (r < crater_param[2].x) {  
    ...  
} else ...
```

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Height

⇒ In shader:

- Determine fragment distance from center

```
r = length(position - center);
```

- Determine which region contains the fragment

```
if (r < crater_param[1].x) {  
    ...  
} else if (r < crater_param[2].x) {  
    ...  
} else ...
```

- Determine fragment location in region

```
t = (r - crater_param[n].x)  
    / (crater_param[n+1].x - crater_param[n].x);
```

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Height

⇒ In shader:

- Determine fragment distance from center

```
r = length(position - center);
```

- Determine which region contains the fragment

```
if (r < crater_param[1].x) {  
    ...  
} else if (r < crater_param[2].x) {  
    ...  
} else ...
```

- Determine fragment location in region

```
t = (r - crater_param[n].x)  
    / (crater_param[n+1].x - crater_param[n].x);
```

- Perform interpolation

```
h = mix(crater_param[n+1].y, crater_param[n].y, t);
```

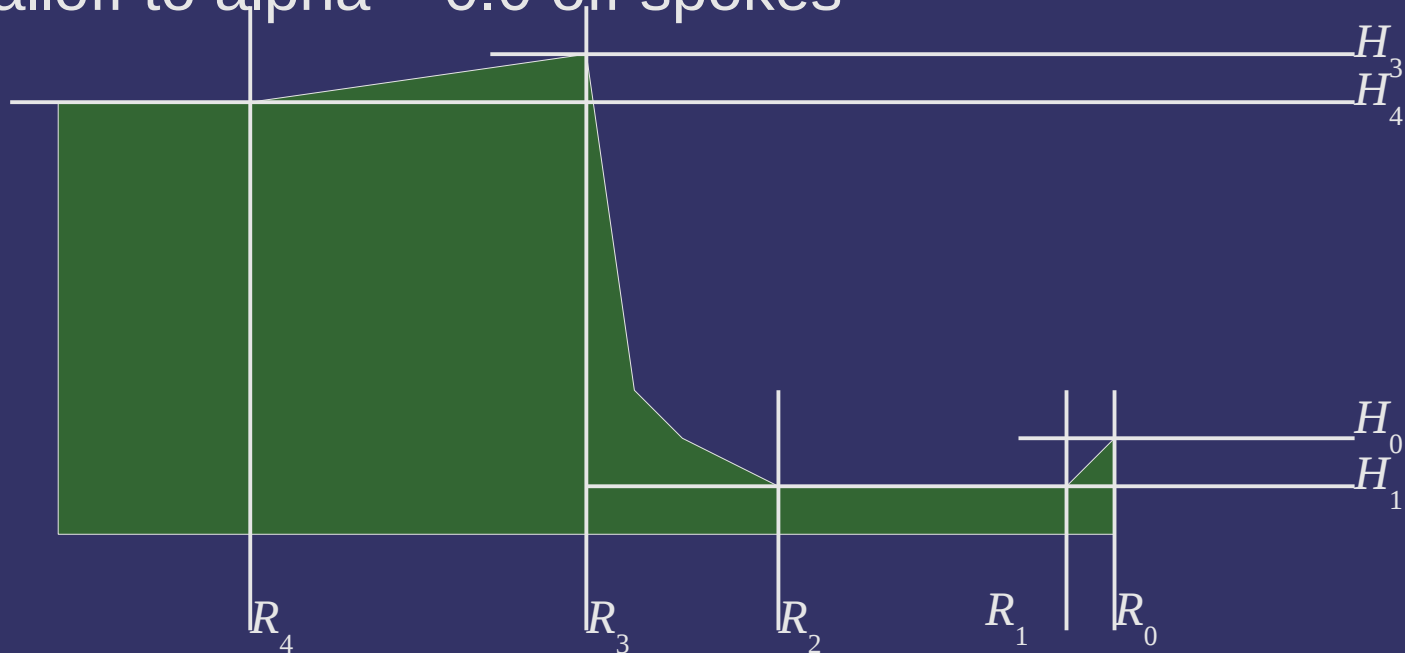

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Color

- ⇒ Color works in a similar manner
 - Use one color inside the crater with alpha set to 1.0
 - Use another color outside the crater
 - Set alpha to 1.0 in “spokes” from crater
 - Falloff to alpha = 0.0 off spokes

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Color

- ⇒ Selecting crater interior color is trivial
 - If r is less than R_3 , use interior color

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Color

- ⇒ Selecting crater interior color is trivial
 - If r is less than R_3 , use interior color
- ⇒ Selecting spoke color is more complex

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Color

- ⇒ Selecting crater interior color is trivial
 - If r is less than R_3 , use interior color
- ⇒ Selecting spoke color is more complex
 - Need to know distance from center *and* angle (i.e., polar coordinates)

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Color

- ⇒ Selecting crater interior color is trivial
 - If r is less than R_3 , use interior color
- ⇒ Selecting spoke color is more complex
 - Need to know distance from center *and* angle (i.e., polar coordinates)
 - Place spokes separated by fixed angles
 - Spokes are determined by a cosine wave in polar coordinates
 - $r_{spoke} = \cos(\alpha \times frequency)$

5-March-2009

© Copyright Ian D. Romanick 2008

Crater Shader – Color

- ⇒ Selecting crater interior color is trivial
 - If r is less than R_3 , use interior color
- ⇒ Selecting spoke color is more complex
 - Need to know distance from center *and* angle (i.e., polar coordinates)
 - Place spokes separated by fixed angles
 - Spokes are determined by a cosine wave in polar coordinates
 - $r_{spoke} = \cos(\alpha \times frequency)$
 - Select random length and thickness for each spoke

– Noise to the rescue

– Thickness is determined by raising ($r_{spoke} \times amplitude$) to a

Break

5-March-2009

© Copyright Ian D. Romanick 2008

Brief history of noise

- Developed by Ken Perlin in the early 80s
 - Ken worked on the revolutionary graphics for the movie *Tron*
 - Frustrated that *Tron's* graphics looked so “machine-like,” he wanted to escape the “machine-look ghetto.”
- *Tron* was not nominated for the Academy Award for Special Effects
 - It “cheated” by using computers
 - What movie won?

5-March-2009

© Copyright Ian D. Romanick 2008

Brief history of noise

- Developed by Ken Perlin in the early 80s
 - Ken worked on the revolutionary graphics for the movie *Tron*
 - Frustrated that *Tron's* graphics looked so “machine-like,” he wanted to escape the “machine-look ghetto.”
- *Tron* was not nominated for the Academy Award for Special Effects
 - It “cheated” by using computers
 - What movie won?
 - *E.T. the Extra Terrestrial* won, defeating *Blade Runner* and *Poltergeist*

5-March-2009

© Copyright Ian D. Romanick 2008

Brief history of noise

- In 1983 Perlin worked on creating a space filling, apparently random signal function
 - Needed to appear random
 - Needed to be controllable
 - Needed all features to be approx. the same size
 - Needed all the features to be roughly isotropic
 - Needed to have a range [-1, 1]
- First presented as a course at SIGGRAPH '84
 - The paper followed at SIGGRAPH '85
 - The Academy Award for Technical Achievement followed in 1997

5-March-2009

© Copyright Ian D. Romanick 2008

Using Noise

- In Perlin's words, “noise is salt for graphics.”
 - Salt by itself is boring
 - Without salt, food is boring too

Original image from http://en.wikipedia.org/wiki/Perlin_noise

5-March-2009

© Copyright Ian D. Romanick 2008

Using Noise

- Noise is typically used in multiple frequencies
 - Each frequency band is called an *octave*
 - As octave frequency increases, the amplitude decreases

$$NOISE(p) = \sum_{i=0}^{N-1} \frac{noise(f_i, p)}{a_i}$$

5-March-2009

© Copyright Ian D. Romanick 2008

Using Noise

- Add noise to boring functions or textures to make them interesting
 - Marble is the *classic* example

$$\sin(x + |NOISE(y)|)$$

Original image from <http://www.noisemachine.com/talk1/23.html>, copyright Ken Perlin

5-March-2009

© Copyright Ian D. Romanick 2008

Implementing Noise

- ⇒ Use GLSL noise function
 - Most (all?) implementations are *really* bad
 - Some just return a constant value for all inputs!

5-March-2009

© Copyright Ian D. Romanick 2008

Implementing Noise

- ⇒ Implement noise in C, generate noise texture
 - Tiling artifacts
 - Consumes texture resources

5-March-2009

© Copyright Ian D. Romanick 2008

Implementing Noise

⇒ Implement noise in GLSL code

- Several implementations exist:

Green, Simon. “Implementing Improved Perlin Noise.” GPU Gems 2. Ed. Matt Pharr. Upper Saddle River, NJ: Pearson Education, Inc., April 2005.

http://http.developer.nvidia.com/GPUGems2/gpugems2_chapter26.html

Olano, Marc. “Modified Noise for Evaluation on Graphics Hardware.” Proceedings of Graphics Hardware 2005, Eurographics/ACM SIGGRAPH, July 2005.

<http://www.cs.umbc.edu/~olano/papers/mNoise.pdf>

- Most use several textures for tables
- Use 60 – 80 GPU instructions

5-March-2009

Anti-aliasing Procedural Textures

- ⇒ How can we control aliasing in procedural textures?
 - No magic mipmapping for procedural textures!
- ⇒ Three common solutions:
 - Supersampling – expensive!
 - Analytical anti-aliasing – difficult!
 - Render to a texture, use mipmapping – sets an upper bound on texture resolution, may consume a lot of memory

5-March-2009

© Copyright Ian D. Romanick 2008

Anti-aliasing – Supersampling

- Determine the size / shape of the sample area
 - The GLSL functions $dFdx()$, $dFdy()$, and `fwidth()` provide this information
 - These are called *partial derivatives*
 - Roughly the same information used by the texture filtering hardware

5-March-2009

© Copyright Ian D. Romanick 2008

Anti-aliasing – Supersampling

- ⇒ Perform multiple texture calculations within the sample area
 - A rectangle based on $dFdx()$ and $dFdy()$ should be sufficient
 - Filter (average) the results

5-March-2009

© Copyright Ian D. Romanick 2008

Anti-aliasing – Analytical

- ⇒ Formulate the shader to calculate the average color over an area
 - Usually ranges from difficult to nearly impossible

5-March-2009

© Copyright Ian D. Romanick 2008

Anti-aliasing – Index Aliasing

- ⇒ Sometimes the boundary function causes aliasing
 - Remember the toy ball shader:

5-March-2009

© Copyright Ian D. Romanick 2008

Anti-aliasing – Index Aliasing

- Sometimes the boundary function causes aliasing
 - Remember the toy ball shader:

5-March-2009

© Copyright Ian D. Romanick 2008

Anti-aliasing – Index Aliasing

- ⇒ step function adds unnecessary high frequency components
 - Instead use smoothstep based on the width of the sample area

5-March-2009

© Copyright Ian D. Romanick 2008
