

VGP353 – Week 1

⇒ Agenda:

- Course road-map
- Introduce shadows
 - Importance of shadows
 - Planar projected shadows
 - Soft shadows
 - Shadow textures
- Projective texturing review
- First programming assignment

14-July-2009

© Copyright Ian D. Romanick 2009

What should you already know?

- ⇒ All of the prerequisites of VGP351 & VGP352:
 - C++ and object-oriented programming
 - Basic graphics terminology and concepts
 - Some knowledge of linear algebra and vector math
 - Using OpenGL extensions
 - OpenGL Shading Language

14-July-2009

© Copyright Ian D. Romanick 2009

What will you learn?

- Algorithms and supporting data-structures for implementing shadows
 - Planar projected shadows
 - Shadow textures
 - Shadow maps
 - Shadow volumes

14-July-2009

© Copyright Ian D. Romanick 2009

Grading

- ⇒ Tests and quizzes
 - Bi-weekly quizzes worth 5 points each
 - Final exam worth 50 points
- ⇒ Four programming assignments
 - Two will be smallish and worth 10 points
 - Two will be largeish and worth 20 points
- ⇒ One in-class presentation worth 10 points

14-July-2009

© Copyright Ian D. Romanick 2009

Grading – Programming Assignments

- Does the program produce the correct output?
- Are the required algorithms / data-structures used?
- Is the code readable and clear?
 - This includes both C++ code *and* shader code!

14-July-2009

© Copyright Ian D. Romanick 2009

Grading – In-class Presentation

- Select one paper assigned during the term
- Present a summary of the paper to the class
 - What is the problem being solved?
 - How does the paper solve the problem?
 - What is the overall algorithm?
 - What simplifying assumptions are made?
 - What class of hardware does it target?
 - What is novel about the presented solution?
 - What is the paper's contribution?
 - What questions are left unanswered?
 - What areas remain for further research?

14-July-2009

Shadow Terms

- Receiver – object that is shadowed
- Caster – object that blocks light from the receiver
 - May also be called *occluder* because it occludes the light from the receiver
- Umbra – Region on receiver that is completely shadowed
- Penumbra – Transition region between umbra and non-shadowed area

14-July-2009

Shadows

⇒ Why are shadows important to 3D rendering?

14-July-2009

© Copyright Ian D. Romanick 2009

Shadows

- Why are shadows important to 3D rendering?
 - Provide additional information about shadow casters
 - Relative position of casters
 - Relative position of casters and receivers
 - Provide additional information about shadow receivers
 - Show additional surface detail

14-July-2009

© Copyright Ian D. Romanick 2009

Planar Projected Shadows

- Simplest shadow algorithm: project object geometry directly onto a flat plane

14-July-2009

© Copyright Ian D. Romanick 2009

Planar Projected Shadows

- Simplest shadow algorithm: project object geometry directly onto a flat plane
 - As the description implies, this is accomplished using a projection matrix

14-July-2009

© Copyright Ian D. Romanick 2009

Planar Projected Shadows

- Given a point on a plane, p , and the normal of that plane, n , the plane equation is:

$$d = -(n \cdot p)$$

$$n \cdot p_i + d = 0$$

- Every p_i where this equation is 0, is “on” the plane

14-July-2009

© Copyright Ian D. Romanick 2009

Planar Projected Shadows

- Given a plane, defined by n and d , and a projection point, L , create a matrix that projects an arbitrary point onto that plane:

$$M_p = \begin{bmatrix} n \cdot L + d - L_x n_x & -L_x n_y & -L_x n_z & -L_x d \\ -L_y n_x & n \cdot L + d - L_y n_y & -L_y n_z & -L_y d \\ -L_z n_x & -L_z n_y & n \cdot L + d - L_z n_z & -L_z d \\ -n_x & -n_y & -n_z & n \cdot L \end{bmatrix}$$

- This matrix is similar to the matrix used to project onto the view plane from the eye point

14-July-2009

© Copyright Ian D. Romanick 2009

Planar Projected Shadows

- If n and d define the ground plane and L is the position of the light, M_p will project world-space geometry onto the ground plane

14-July-2009

© Copyright Ian D. Romanick 2009

Planar Projected Shadows

- If n and d define the ground plane and L is the position of the light, M_p will project world-space geometry onto the ground plane
- Question: Where do we insert M_p in the transformation matrix?

14-July-2009

© Copyright Ian D. Romanick 2009

Planar Projected Shadows

- If n and d define the ground plane and L is the position of the light, M_p will project world-space geometry onto the ground plane
- Question: Where do we insert M_p in the transformation matrix?
 - Answer: After the object-to-world space transformations, but before the world-to-eye space transformation

$$M = M_{eye} M_p M_{world}$$

Planar Projected Shadows

⇒ Can be drawn several different ways

14-July-2009

© Copyright Ian D. Romanick 2009

Planar Projected Shadows

⇒ Can be drawn several different ways

- Disable depth buffer writes

```
glDepthMask(GL_FALSE);
```

- Draw shadow to alpha component

```
glColorMask(GL_FALSE, GL_FALSE, GL_FALSE, GL_TRUE);
```

- Re-enable depth buffer writes

```
glDepthMask(GL_TRUE);
```

- Draw object normally

- Draw ground plane and modulate with destination alpha

```
glEnable(GL_BLEND);
```

```
glBlendFunc(GL_ONE_MINUS_DST_ALPHA, GL_ONE);
```

Hard Shadows vs. Soft Shadows

- ⇒ Hard shadows are better than nothing, but still not very realistic
 - Perfectly hard shadows are only cast by infinitesimal light sources...the super bright LED in a dark room
 - Or if the light is *very* far away from the shadow caster relative to the size of the light source
 - If the light has any area, it will cast soft shadows

14-July-2009

Hard Shadows vs. Soft Shadows

⇒ Hard shadows are better than nothing, but still not very realistic

- Perfectly hard shadows are only cast by infinitesimal light sources...the super bright LED in a dark room
- Or if the light is *very* far away from the shadow caster relative to the size of the light source
- If the light has any area, it will cast soft shadows

Really talking about the solid angle of the light from the PoV of the occluder

Hard Shadows vs. Soft Shadows

- Hard shadows are better than nothing, but still not very realistic
 - Perfectly hard shadows are only cast by infinitesimal light sources...the super bright LED in a dark room
 - Or if the light is *very* far away from the shadow caster relative to the size of the light source
 - If the light has any area, it will cast soft shadows
- Can this technique be extended to create soft shadows?

14-July-2009

Heckbert and Herf's Method

- ⇒ Simulate an area light with many point lights on the area light's surface
 - If *lots* of sample points are used, this method produces *very good* results

14-July-2009

© Copyright Ian D. Romanick 2009

Heckbert and Herf's Method

- Simulate an area light with many point lights on the area light's surface
 - If *lots* of sample points are used, this method produces *very good* results
 - If *lots* of sample points are used, this method produces *very slow* results

14-July-2009

© Copyright Ian D. Romanick 2009

Heckbert and Herf's Method

- Simulate an area light with many point lights on the area light's surface
 - If *lots* of sample points are used, this method produces *very good* results
 - If *lots* of sample points are used, this method produces *very slow* results
 - Some optimizations are possible:
 - Scale number of samples with size of light
 - Scale number of samples with distance between light and shadow caster

14-July-2009

© Copyright Ian D. Romanick 2009

Gooch's Method

- By moving the receiving plane towards and away from the light, the penumbra can be simulated
 - Accomplished by biasing d in the plane equation
 - After the projecting onto the offset plane, move the projected (flattened) object back
 - The simulated penumbra is always too big

Planar Projected Shadows

- As discussed previously, planar projected shadows have a number of faults

14-July-2009

© Copyright Ian D. Romanick 2009

Planar Projected Shadows

- As discussed previously, planar projected shadows have a number of faults
 - No self-shadowing
 - Can only cast shadows on the ground plane

14-July-2009

© Copyright Ian D. Romanick 2009

Planar Projected Shadows

- As discussed previously, planar projected shadows have a number of faults
 - No self-shadowing
 - Can only cast shadows on the ground plane
 - Can only cast shadows on a *flat* ground plane

14-July-2009

© Copyright Ian D. Romanick 2009

Planar Projected Shadows

- ⇒ As discussed previously, planar projected shadows have a number of faults
 - No self-shadowing
 - Can only cast shadows on the ground plane
 - Can only cast shadows on a *flat* ground plane
- ⇒ Shadow textures fix *most* of these problems

14-July-2009

© Copyright Ian D. Romanick 2009

Shadow Textures

⇒ Algorithm outline:

- Render shadow caster to a texture from the point of view of the light
 - Texture background is the color of the light
 - Object is rendered in black
- Using *projective texturing* cast the shadow texture onto each shadow receiver
- Use the sampled texture color as the light color

14-July-2009

© Copyright Ian D. Romanick 2009

Shadow Textures

⇒ Advantages?

Original image from *Battlefield 1942* © Copyright Digital Illusions CE 2002.

14-July-2009

© Copyright Ian D. Romanick 2009

Shadow Textures

⇒ Advantages?

- Can cast shadows on non-flat surfaces
- Can cast shadows on multiple objects

Original image from *Battlefield 1942* © Copyright Digital Illusions CE 2002.

14-July-2009

© Copyright Ian D. Romanick 2009

Shadow Textures

⇒ Advantages?

- Can cast shadows on non-flat surfaces
- Can cast shadows on multiple objects

⇒ Disadvantages?

Shadow Textures

➤ Advantages?

- Can cast shadows on non-flat surfaces
- Can cast shadows on multiple objects

➤ Disadvantages?

- No self-shadowing
 - Shadow *maps* will solve this problem...next week
- Requires render-to-texture pass for *each* shadow caster for each light
- Shadow receiver must sample multiple shadow textures

Original image from *Battlefield 1942* © Copyright Digital Illusions CE 2002.

14-July-2009

Shadow Texture Creation

- Setup model-view-projection matrix to render from the light looking at the object
 - The light position becomes the eye-point
 - Set the FoV to just enclose the object
 - The object's bounding box is helpful here
- Render object as shadow
 - Clear the color buffer to the light's color
 - Render the object as solid black
 - Can “fake” soft shadows by using distance from light (eye) to determine color: closer to the light is darker, farther is lighter

14-July-2009

© Copyright Ian D. Romanick 2009

Determining Receiver / Caster

- ⇒ For each shadow texture, determine which objects are potential receivers
 - If the object is *completely* on the opposite side of the near plane from the light, it is a candidate

14-July-2009

© Copyright Ian D. Romanick 2009

Projective Texturing

- ⇒ Does what it says: projects a texture onto an object
- ⇒ This is a *perspective* projection, so what is needed to make it “work”?

14-July-2009

© Copyright Ian D. Romanick 2009

Projective Texturing

- ⇒ Does what it says: projects a texture onto an object
- ⇒ This is a *perspective* projection, so what is needed to make it “work”?
 - Divide by Z ...just like perspective viewing projections
 - Uses the q texture coordinate

14-July-2009

© Copyright Ian D. Romanick 2009

Projective Texturing

➤ Algorithm outline:

- Use object-space vertex positions as initial texture coordinates
- Transform object-space texture coordinate to projector-space
- Apply perspective transformation
 - Same MVP matrix as is used to render to the texture
- Scale and bias coordinates from $[-1, 1]$ to $[0, 1]$
 - Unless one of the mirroring wrap modes is being used

14-July-2009

© Copyright Ian D. Romanick 2009

Projective Texturing

- ⇒ Uses different sampling functions in GLSL:
 - `texture[123]DProj` vs `texture[123]D`
 - Use these functions instead of doing the perspective divide by hand
 - Cubic textures are not supported. Why?

14-July-2009

© Copyright Ian D. Romanick 2009

Projective Texturing

- ⇒ Uses different sampling functions in GLSL:
 - `texture[123]DProj` vs `texture[123]D`
 - Use these functions instead of doing the perspective divide by hand
 - Cubic textures are not supported. Why?
 - The q component is already used as part of the texture lookup!

14-July-2009

© Copyright Ian D. Romanick 2009

Projective Texturing

⇒ What happens if the point is *behind* the projection point?

Hint: What happens if an object is behind the eye?

14-July-2009

© Copyright Ian D. Romanick 2009

Projective Texturing

➤ What happens if the point is *behind* the projection point?

Hint: What happens if an object is behind the eye?

- It gets a *negative* Z (or q) value
- The projection then “flips” the position
 - Because it divides by a negative number

14-July-2009

© Copyright Ian D. Romanick 2009

Optimizations

- Performance problems with shadow textures:
 - Lots of textures need to be generated *per frame*
 - Shadow receivers need to read lots of textures
- General speed-up techniques:
 - Regenerate a texture only if light or caster moved
 - Generate textures for shadows that might intersect view volume
 - Apply texture only to objects that might be shadowed
 - Composite multiple shadow textures together

14-July-2009

© Copyright Ian D. Romanick 2009

Optimizations

- Generate textures for shadows that might intersect view volume
 - Each shadow texture has an associated frustum
 - “View” frustum used to render the shadow texture
 - If the shadow's frustum intersects the view (eye) frustum, then it *might* be visible

14-July-2009

© Copyright Ian D. Romanick 2009

Optimizations

- Apply texture only to objects that might be shadowed
 - Any object that does not intersect the shadow's frustum is not a receiver

14-July-2009

© Copyright Ian D. Romanick 2009

Optimizations

- ⇒ Composite multiple shadow textures together
 - Many casters can affect all members of a group of receivers
 - Create a new shadow texture by compositing all potential casters shadow textures together
 - Project each shadow texture onto the near-plane
