

# VGP352 – Week 4

## ⇒ Agenda:

- BRDFs, part 1
  - Common ideas and terminology
  - Cook-Torrance BRDF
  - Micro-facet based BRDFs
- Hand in assignment #1
- Start assignment #2

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# BRDF

## ⇒ Bi-directional reflectance distribution function

– Notation is  $f(\omega_o, \omega_i)$

“...describes the ratio of reflected radiance exiting from a surface in a particular direction (defined by the vector  $\omega_o$ ) to the irradiance incident on the surface from direction  $\omega_i$  over a particular waveband.”

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# BRDF

## ⇒ In English...

- Given an arbitrary input direction,  $\omega_i$ , and an arbitrary output direction,  $\omega_o$ , we can calculate the ratio of energy (light) transferred from  $\omega_i$  to  $\omega_o$

## ⇒ What does this tell us?

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# BRDF

## ⇒ In English...

- Given an arbitrary input direction,  $\omega_i$ , and an arbitrary output direction,  $\omega_o$ , we can calculate the ratio of energy (light) transferred from  $\omega_i$  to  $\omega_o$

## ⇒ What does this tell us?

- If we know where the light is coming from, we can calculate how much of the light is reflected in any direction
- If we know a light reflection direction (i.e., viewing direction) we can calculate the contribution of every possible light input direction

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# BRDF

- ⇒  $\omega$  consists of the two angles:
- $\theta$  is the elevation angle, and it is measured relative to the surface normal
  - $\phi$  is the azimuth angle, and it is measured relative to the surface tangent

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# BRDFs for Lighting

⇒  $\omega$  is a *solid angle*

“The solid angle,  $\Omega$ , is the angle in three-dimensional space that an object subtends at a point. It is a measure of how big that object appears to an observer looking from that point.”<sup>1</sup>

- Each  $\omega$  is a direction and a “slice” from the volume of the hemisphere around the point in question

<sup>1</sup> From [http://en.wikipedia.org/wiki/Solid\\_angle](http://en.wikipedia.org/wiki/Solid_angle)

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# *BRDFs for Lighting*

⇒ Why is it significant that  $\omega$  is a solid angle?

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# BRDFs for Lighting

- Why is it significant that  $\omega$  is a solid angle?
  - The size of a light from the POV of the receiver is significant
    - The ISS doesn't receive much illumination from Gliese 581, but it would if it were orbiting of one of Gliese 581's planets<sup>1</sup>
    - At 20.3 light years away, Gliese 581 has a tiny solid angle
    - At only ~2 million miles away, its solid angle is much larger
    - 0.00000024° vs. 1.28°
  - Could also use the area of the light projected onto a sphere around the receiver
    - As will be seen later, these units would not be convenient

<sup>1</sup> [http://en.wikipedia.org/wiki/Gliese\\_581](http://en.wikipedia.org/wiki/Gliese_581)

# BRDFs for Lighting

- The amount of light reflected from a particular input vector to a particular output vector:

$$L(\omega_o) = f(\omega_o, \omega_i) L(\omega_i) \cos \theta_i$$

Outgoing light  
intensity

A.k.a  $n \cdot l$

Incoming light  
intensity

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# *BRDFs for Lighting*

- What if we want to calculate the amount light reflected to a particular output vector from *all possible* input vectors?

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# BRDFs for Lighting

- What if we want to calculate the amount light reflected to a particular output vector from *all possible* input vectors?

$$L(\omega_o) = \int_{\Omega} f(\omega_o, \omega_i) L(\omega_i) \cos \theta_i d\omega_i$$

- Integration over a solid angle works just like any other integration
- This integral is over the hemisphere above the point
  - This is a solid angle of  $2\pi$
- Most BRDFs will contain a  $1/\pi$  factor because of this

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# BRDF Properties

➤ Physically based BRDFs have two important properties:

– Helmholtz reciprocity:

$$f(\omega_i, \omega_o) = f(\omega_o, \omega_i)$$

– Also called Helmholtz Stereopsis

– This is the “bi-directional” part of BRDF

– Conservation of energy:

$$\forall \omega_i, \int_{\Omega} f(\omega_i, \omega_o) \cos \theta_o d\omega_o \leq 1$$

2-February-2010

# *Where do BRDFs come from?*

## ⇒ Measured BRDFs

- Measure every possible output from every possible output
- Oregon BRDF Library (and others) have data captured from these instruments available

# Where do BRDFs come from?

## ⇒ Measured BRDFs

- Measure every possible output from every possible output
- Oregon BRDF Library (and others) have data captured from these instruments available

## ⇒ Analytical BRDFs

- Mathematical models used to reproduce observed behavior
- May be derived from simplified measured data

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Cook-Torrance BRDF

- ⇒ One of the oldest BRDFs used in graphics
  - Published by Robert Cook and Ken Torrance in 1982
    - Cook was at Lucasfilm, Ltd.
    - Torrance was at Cornell
  - Based on *micro-facets*

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-Facet Primer

- Surfaces are made of numerous infinitesimal subsurfaces that act as perfect mirrors
  - Distribution of the normals of these subsurfaces determines how specular the surface appears
  - Micro-facets can obscure other micro-facets both from the light and from the viewer
- We'll dive deep into both these aspects soon...

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Cook-Torrance BRDF

$$f(\omega_o, \omega_i) = \mathbf{k}_d f_d + \mathbf{k}_s f_s(\omega_o, \omega_i)$$

$$f_d = 1/\pi$$

$$f_s(\omega_o, \omega_i) = 1/\pi \frac{F \times D(\mathbf{n} \cdot \mathbf{h}) \times G(\mathbf{n} \cdot \omega_i, \mathbf{n} \cdot \mathbf{h}, \mathbf{n} \cdot \omega_o)}{(\mathbf{n} \cdot \omega_i)(\mathbf{n} \cdot \omega_o)}$$

- F is the Fresnel factor
- D is the distribution of micro-facet normals
- G is the geometry occlusion factor
- $\mathbf{h}$  is the half-vector from the Blinn-Phong lighting equation

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-facet Distribution

- Micro-facet normals are random, but follow some distribution function
  - Sometimes call the *normal distribution function* (NDF)
  - Several models exist
  - Cook-Torrance uses the Beckmann Distribution:

$$D(\mathbf{n} \cdot \mathbf{h}) = \frac{1}{4 m^2 (\mathbf{n} \cdot \mathbf{h})^4} e^{-\left(\frac{1 - (\mathbf{n} \cdot \mathbf{h})^2}{(\mathbf{n} \cdot \mathbf{h})^2 m^2}\right)}$$

- $m$  is a parameter that controls the smoothness of the surface

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Geometry Occlusion Factor

- Represents the decrease in light transmission caused by occlusion of the light or viewer by other micro-facets

$$G(\mathbf{n} \cdot \omega_i, \mathbf{n} \cdot \mathbf{h}, \mathbf{n} \cdot \omega_o) = \min \left( 1, \frac{2(\mathbf{n} \cdot \mathbf{h})(\mathbf{n} \cdot \omega_o)}{\omega \cdot \mathbf{h}}, \frac{2(\mathbf{n} \cdot \mathbf{h})(\mathbf{n} \cdot \omega_i)}{\omega \cdot \mathbf{h}} \right)$$

- Why aren't there any subscripts on  $\omega$  in the denominators?
  - Hint:  $\omega_i \cong \mathbf{l}$  and  $\omega_o \cong \mathbf{v}$

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Geometry Occlusion Factor

- Represents the decrease in light transmission caused by occlusion of the light or viewer by other micro-facets

$$G(\mathbf{n} \cdot \omega_i, \mathbf{n} \cdot \mathbf{h}, \mathbf{n} \cdot \omega_o) = \min \left( 1, \frac{2(\mathbf{n} \cdot \mathbf{h})(\mathbf{n} \cdot \omega_o)}{\omega \cdot \mathbf{h}}, \frac{2(\mathbf{n} \cdot \mathbf{h})(\mathbf{n} \cdot \omega_i)}{\omega \cdot \mathbf{h}} \right)$$

- Why aren't there any subscripts on  $\omega$  in the denominators?

- Hint:  $\omega_i \cong \mathbf{l}$  and  $\omega_o \cong \mathbf{v}$

- $\mathbf{h}$  is half way between  $\mathbf{v}$  and  $\mathbf{l}$ :

$$\angle \mathbf{l} \mathbf{h} = \angle \mathbf{v} \mathbf{h} \therefore (\mathbf{h} \cdot \omega_i) = (\mathbf{h} \cdot \omega_o)$$

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Cook-Torrance Diffuse Factor

⇒ Cook-Torrance diffuse factor:

$$f_d = 1/\pi$$

⇒ “Typical” diffuse factor:

$$\mathbf{k}_d = \mathbf{n} \cdot \mathbf{l}$$

⇒ Remember how the BRDF is used:

$$L(\omega_o) = f(\omega_o, \omega_i) L(\omega_i) \cos \theta_i$$

- We just want to scale the incoming energy by the total angle and let the built in  $(\mathbf{n} \cdot \omega_i)$  do the rest
- Remember  $\omega_i \cong \mathbf{l}$

# *Micro-Facet Deep Dive*

- Surfaces are made of numerous infinitesimal subsurfaces that act as perfect mirrors
  - Each facet only reflects light along the ideal reflection vector
  - Determining the number of visible facets for a given  $\mathbf{v}$  and  $\mathbf{l}$  is enough to determine the BRDF

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-Facet Deep Dive

⇒ Add two assumptions:

- Facet normals are distributed randomly according to some distribution function  $p(\mathbf{h})$
- A facet only contributes if it is visible to both  $\mathbf{v}$  and  $\mathbf{l}$

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-Facet Deep Dive

- ⇒ BRDF is determined by:
  - Fresnel term
  - Fraction of micro-facets with  $\mathbf{n} = \mathbf{h}$
  - Fraction of micro-facets visible to both  $\mathbf{l}$  and  $\mathbf{v}$ 
    - Non-visible to  $\mathbf{l}$  is often called “shadowing”
    - Non-visible to  $\mathbf{v}$  is often called “masking”
    - Both can just be called “occlusion”

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Normal Distribution

- Given  $\mathbf{n}$ , determine the fraction of micro-facet normals that point towards  $\mathbf{h}$ 
  - Can use arbitrary function to calculate this probability
    - May be convenient to encode this in a texture
  - Gaussian or *standard normal distribution* function seems like a good choice
    - The more different the  $\mathbf{h}$  is from  $\mathbf{n}$ , the lower the probability

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# *Gaussian Distribution*

$$P(\theta) = \frac{1}{\sigma \sqrt{2\pi}} e^{-\left(\frac{\theta^2}{2\sigma^2}\right)}$$

$\sigma$  is the standard deviation

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Gaussian Distribution

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Gaussian Distribution

$$P(\theta) = \frac{1}{\sigma \sqrt{2\pi}} e^{-\left(\frac{\theta^2}{2\sigma^2}\right)}$$

$\sigma$  is the standard deviation

- Looking at the graph, why is this distribution unsuitable?

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Gaussian Distribution

$$P(\theta) = \frac{1}{\sigma \sqrt{2\pi}} e^{-\left(\frac{\theta^2}{2\sigma^2}\right)}$$

$\sigma$  is the standard deviation

⇒ Looking at the graph, why is this distribution unsuitable?

- As  $\sigma$  increases, the effective range increases to  $\infty$
- Distribution is based on  $\theta$ , but we only know  $\cos(\theta)$

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Beckmann Distribution

$$P(\theta) = \frac{1}{4m^2 \cos^4 \theta} e^{-\left(\frac{\tan^2 \theta}{m^2}\right)}$$

$m$  is average slope of the surface micro-facets

- ⇒ Physically based model of rough surfaces
  - Based on Beckmann's research in the early 60s
- ⇒ All calculations are based on  $\cos(\theta)$ !
  - Remember:  $\tan^2(\theta)$  is  $(1 - \cos^2(\theta)) / \cos^2(\theta)$

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Beckmann Distribution

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-facet Occlusion

- Determine the probability of a facet being visible to the light and to the viewer
  - Use one probability function,  $P_{\text{vis}}(\theta)$ , for the probability of visibility to either  $\mathbf{l}$  or  $\mathbf{v}$
  - Assume that visibility and orientation are uncorrelated

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-facet Occlusion

⇒ Given  $P_{\text{vis}}(\theta_v)$  and  $P_{\text{vis}}(\theta_l)$ , what is  $P_{\text{vis}}(\theta_v \cap \theta_l)$ ?

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-facet Occlusion

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-facet Occlusion

- ⇒ Given  $P_{\text{vis}}(\theta_v)$  and  $P_{\text{vis}}(\theta_l)$ , what is  $P_{\text{vis}}(\theta_v \cap \theta_l)$ ?
- Generating a new probability function from dependent probability functions is a difficult problem in general
  - $P_{\text{vis}}(\theta_v) \times P_{\text{vis}}(\theta_l) < P_{\text{vis}}(\theta_v \cap \theta_l)$ 
    - $P(A)P(B) = P(A \cap B) \leftrightarrow A$  and  $B$  are independent
    - Visibility to the light and viewer are not independent
      - Example: Put the light and viewer at the same location
  - Cook and Torrance suggest  $\min(P_{\text{vis}}(\theta_v), P_{\text{vis}}(\theta_l))$
  - Other methods exist... the reading for next week contains one

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-facet Occlusion

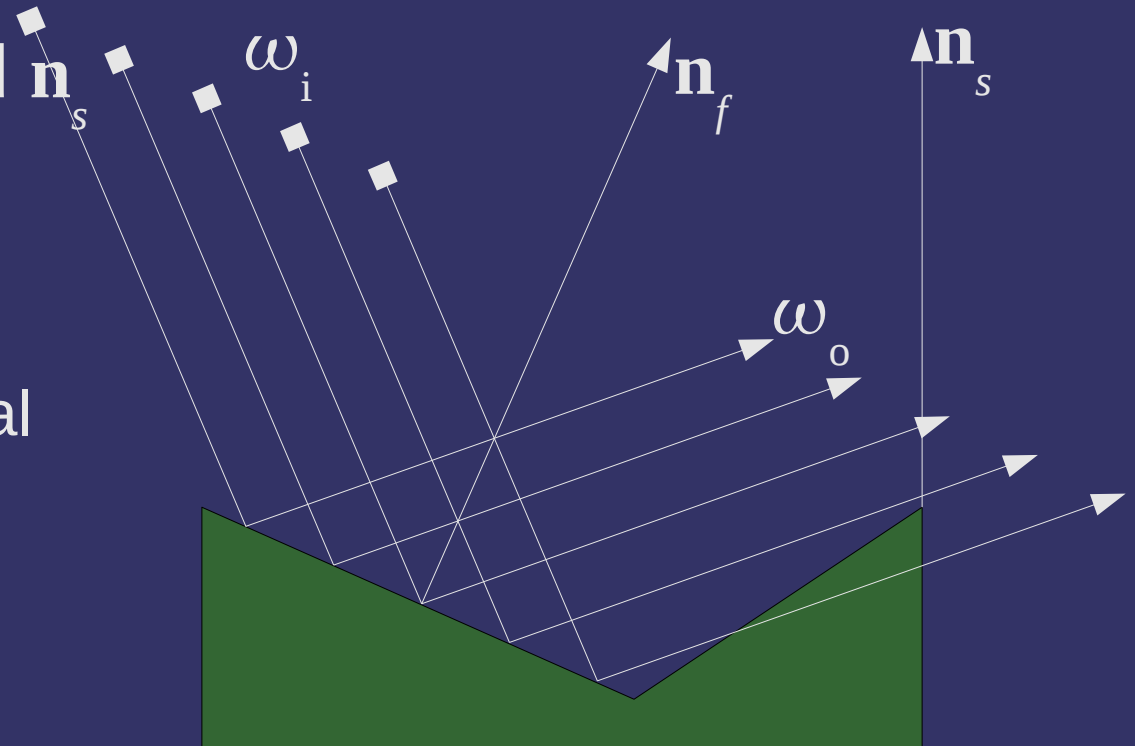

⇒ How do we estimate

$P_{\text{vis}}(\theta)$ ?

– Clearly  $\omega_i$ ,  $\omega_o$ ,  $\mathbf{n}_f$ , and  $\mathbf{n}_s$  are involved

–  $\mathbf{n}_f$  is the facet normal

–  $\mathbf{n}_s$  is the surface normal

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-facet Occlusion

## ⇒ Observations:

– Occlusion increases as:

–  $\angle \mathbf{n}_f \mathbf{n}_s \rightarrow 90^\circ \Leftrightarrow (\mathbf{n}_f \cdot \mathbf{n}_s) \rightarrow 0$

–  $\angle \omega \mathbf{n}_s \rightarrow 90^\circ \Leftrightarrow (\omega \cdot \mathbf{n}_s) \rightarrow 0$

– Occlusion decreases as:

–  $\angle \omega \mathbf{n}_f \rightarrow 90^\circ \Leftrightarrow (\omega \cdot \mathbf{n}_f) \rightarrow 0$

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-facet Occlusion

⇒ Cook-Torrance uses:

$$P_v(\theta) = \frac{2(\mathbf{n}_s \cdot \mathbf{n}_f)(\mathbf{n}_s \cdot \boldsymbol{\omega})}{\boldsymbol{\omega} \cdot \mathbf{n}_f}$$

⇒ What other vector is equivalent to  $\mathbf{n}_f$ ?

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-facet Occlusion

⇒ Cook-Torrance uses:

$$P_v(\theta) = \frac{2(\mathbf{n}_s \cdot \mathbf{n}_f)(\mathbf{n}_s \cdot \boldsymbol{\omega})}{\boldsymbol{\omega} \cdot \mathbf{n}_f}$$

⇒ What other vector is equivalent to  $\mathbf{n}_f$ ?

– By definition,  $\mathbf{n}_f = \mathbf{h}$

$$G_v = \frac{2(\mathbf{n} \cdot \mathbf{h})(\mathbf{n} \cdot \mathbf{v})}{\mathbf{v} \cdot \mathbf{h}}$$

$$G_l = \frac{2(\mathbf{n} \cdot \mathbf{h})(\mathbf{n} \cdot \mathbf{l})}{\mathbf{l} \cdot \mathbf{h}}$$

$$\mathbf{l} \cdot \mathbf{h} = \mathbf{v} \cdot \mathbf{h}$$

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Micro-facet Occlusion

- This turns out to be a poor model
  - Real surfaces aren't made of long, V-shaped channels
  - This reading for next week addresses this as well

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Reading for Next Week

Prepare for next week:

Ashikmin, Michael and Premože, Simon and Shirley, Peter, "A microfacet-based BRDF generator." In *SIGGRAPH '00: Proceedings of the 27th Annual Conference on Computer Graphics and Interactive Techniques*, pages 65–74. ACM Press/Addison-Wesley Publishing Co., 2000.  
<http://www.cs.utah.edu/~shirley/papers/facets.pdf>

2-February-2010

© Copyright Ian D. Romanick 2009, 2010

# Next week...

⇒ Quiz #2

⇒ More BRDFs

- Anisotropic reflection
  - Ward BRDF
  - Ashikhmin BRDF
- Metals
  - How do metals “reflect” light?
  - Lafortune BRDF

2-February-2010
