

# VGP351 – Week 5

## ⇒ Agenda:

- Quiz #2
- Physical theory of light
- Lighting models for graphics
- Shading models for graphics
- Types of lights

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Lighting

- Lighting, in graphics, is the art of *approximately* simulating the manner in which light interacts with materials

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Lighting

➤ Lighting, in graphics, is the art of *approximately* simulating the manner in which light interacts with materials

➤ Remember:

“Light makes right.”

– Andrew Glassner

“If it looks good, it is good.”

– Michael Abrash

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Lighting

- Two fundamental theories of how light works
  - Wave theory of light – Christiaan Huygens proposed in 1690 that light is emitted in all directions as a series of waves

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Double-Slit Experiment

- Thomas Young's 1801 double-slit experiment supports the wave theory
  - Light emitted through two thin slits causes alternating light and dark bands projected on a surface

Image from [http://en.wikipedia.org/wiki/File:Young\\_Diffraction.png](http://en.wikipedia.org/wiki/File:Young_Diffraction.png)

2-November-2011

# Lighting

- Two fundamental theories of how light works
  - Wave theory of light – Christiaan Huygens proposed in 1690 that light is emitted in all directions as a series of waves
  - Particle theory of light – Ibn al-Haytham proposed in 1021 that light beams are made of minuscule energy particles that travel in a straight line at a fixed speed

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Particle Theory – Reflection

- Particle theory of light correctly predicts reflection

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Particle Theory – Reflection

- Particle theory of light correctly predicts reflection
  - This perfect, mirror-like reflection is called *specular reflection*

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Particle Theory – Reflection

- What about “rough” surfaces?
  - Light rays scatter in all directions
  - This is called *diffuse reflection*

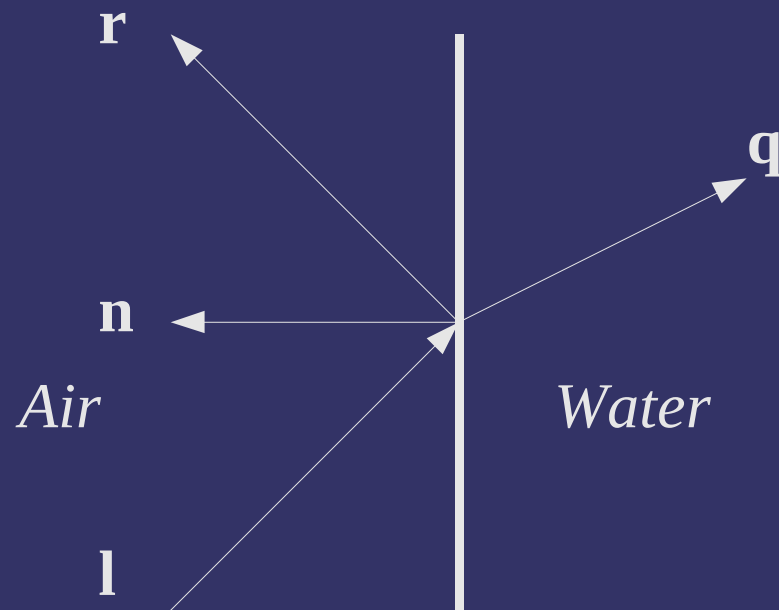

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Wave Theory – Refraction

- When light leaves one material and enters another, it changes direction
  - At the *interface* the speed changes, and the light bends

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Wave Theory – Refraction

Image from <http://en.wikipedia.org/wiki/File:Refraction-with-soda-straw.jpg>

2-November-2011

# Lighting

- Two fundamental theories of how light works
  - Wave theory of light – Christiaan Huygens proposed in 1690 that light is emitted in all directions as a series of waves
  - Particle theory of light – Ibn al-Haytham proposed in 1021 that light beams are made of minuscule energy particles that travel in a straight line at a fixed speed
- So... which is it?
  - It exhibits *both* characteristics depending on the situation
  - See also

# Computer Lighting Models

- Every model is a simplification of the physical phenomena
  - We'll look at three *simple* models today:
    - Lambertian reflection model
    - Phong reflection model
    - Blinn-Phong reflection model
  - We'll look at a number of more complex models next term

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# *Lambertian Reflectance*

- Reflection from ideal diffuse reflectors obeys Lambert's Cosine Law:

The radiant intensity reflected is proportional to the cosine between surface normal and the incoming light

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# *Lambertian Reflectance*

2-November-2011

# *Lambertian Reflectance*

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Lambertian Reflectance

- Reflection from ideal diffuse reflectors obeys Lambert's Cosine Law:

$$\mathbf{i}_d = \frac{\mathbf{l} \cdot \mathbf{n}}{|\mathbf{l}| |\mathbf{n}|} * c_d * \mathbf{l}_d$$

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Lambertian Reflectance

- Reflection from ideal diffuse reflectors obeys Lambert's Cosine Law:

$$\mathbf{i}_d = \frac{\mathbf{l} \cdot \mathbf{n}}{|\mathbf{l}| |\mathbf{n}|} * \mathbf{c}_d * \mathbf{l}_d$$

Vector from the surface to the light

Intensity of the light

Diffuse color of the surface

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Lambertian Reflectance

- Reflection from ideal diffuse reflectors obeys Lambert's Cosine Law:

$$\mathbf{i}_d = \frac{\max(\mathbf{n} \cdot \mathbf{l}, 0)}{|\mathbf{n}| |\mathbf{l}|} * \mathbf{c}_d * \mathbf{l}_d$$

Why is this necessary?

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Lambertian Reflectance

- Reflection from ideal diffuse reflectors obeys Lambert's Cosine Law:

$$\mathbf{i}_d = \frac{\max(\mathbf{n} \cdot \mathbf{l}, 0)}{|\mathbf{n}| |\mathbf{l}|} * \mathbf{c}_d * \mathbf{l}_d$$

Because  $\mathbf{n} \cdot \mathbf{l}$  can be negative. Negative light is nonsense!

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Lambertian Reflectance

- Reflection from ideal diffuse reflectors obeys Lambert's Cosine Law:

$$\mathbf{i}_d = \frac{\max(\mathbf{n} \cdot \mathbf{l}, 0)}{|\mathbf{n}| |\mathbf{l}|} * \mathbf{c}_d * \mathbf{l}_d$$

- Note: viewer is not involved in this calculation
  - Hence, diffuse lighting is *view independent*

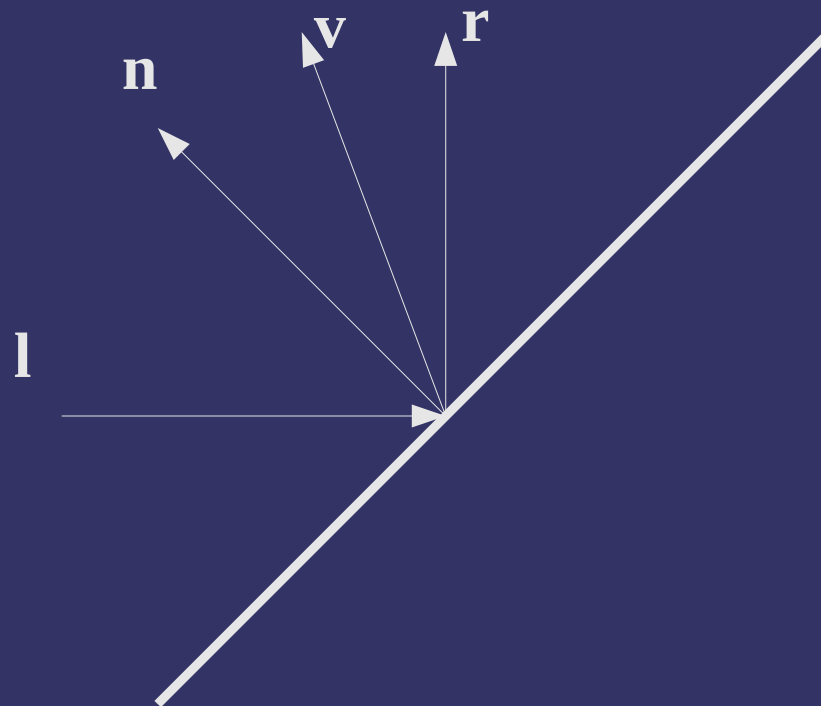

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Phong Reflectance

- Adds a mirror-like reflection factor to the diffuse factor

$$\mathbf{i}_s = \left( \frac{\mathbf{r} \cdot \mathbf{v}}{|\mathbf{r}| |\mathbf{v}|} \right)^s * \mathbf{c}_s * \mathbf{l}_s$$

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Phong Reflectance

- Adds a mirror-like reflection factor to the diffuse factor
  - $\mathbf{n}$ ,  $\mathbf{v}$ , and  $\mathbf{l}$  are known in advance, but  $\mathbf{r}$  is not...but it can be calculated in a few steps

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Phong Reflectance

- Adds a mirror-like reflection factor to the diffuse factor
  - $\mathbf{n}$ ,  $\mathbf{v}$ , and  $\mathbf{l}$  are known in advance, but  $\mathbf{r}$  is not...but it can be calculated in a few steps

# Phong Reflectance

- Adds a mirror-like reflection factor to the diffuse factor
  - $\mathbf{n}$ ,  $\mathbf{v}$ , and  $\mathbf{l}$  are known in advance, but  $\mathbf{r}$  is not...but it can be calculated in a few steps

$$2 * \text{Proj}_{\mathbf{n}}(\mathbf{l}) - \mathbf{l}$$

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Phong Reflectance

- Adds a mirror-like reflection factor to the diffuse factor
  - $\mathbf{n}$ ,  $\mathbf{v}$ , and  $\mathbf{l}$  are known in advance, but  $\mathbf{r}$  is not...but it can be calculated in a few steps

$$\mathbf{r} = \frac{2(\mathbf{n} \cdot \mathbf{l})}{|\mathbf{n}| |\mathbf{l}|} \mathbf{n} - \mathbf{l}$$
$$\mathbf{i}_s = \left( \frac{\mathbf{r} \cdot \mathbf{v}}{|\mathbf{r}| |\mathbf{v}|} \right)^s * \mathbf{c}_s * \mathbf{l}_s$$

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Phong Reflectance

- Adds a mirror-like reflection factor to the diffuse factor
  - $\mathbf{n}$ ,  $\mathbf{v}$ , and  $\mathbf{l}$  are known in advance, but  $\mathbf{r}$  is not...but it can be calculated in a few steps

$$\mathbf{r} = \frac{2(\mathbf{n} \cdot \mathbf{l})}{|\mathbf{n}| |\mathbf{l}|} \mathbf{n} - \mathbf{l}$$

$$\mathbf{i}_s = \left( \frac{\mathbf{r} \cdot \mathbf{v}}{|\mathbf{r}| |\mathbf{v}|} \right)^s * \mathbf{c}_s * \mathbf{l}_s$$

- This is a lot of math... very expensive to calculate.

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Blinn-Phong Reflectance

- ⇒ James Blinn improved Phong's model in 1977
  - Define a vector  $\mathbf{h}$  half way between  $\mathbf{v}$  and  $\mathbf{l}$
  - Observed that as  $\mathbf{v} \cdot \mathbf{r}$  increases, so does  $\mathbf{n} \cdot \mathbf{h}$

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Blinn-Phong Reflectance

- James Blinn improved Phong's model in 1977
  - Observed that as  $\mathbf{v} \cdot \mathbf{r}$  increases, so does  $\mathbf{n} \cdot \mathbf{h}$ , where  $\mathbf{h}$  is a vector half way between  $\mathbf{v}$  and  $\mathbf{l}$

$$\mathbf{h} = \mathbf{l} + \mathbf{v}, \mathbf{i}_s = \left( \frac{\mathbf{n} \cdot \mathbf{h}}{|\mathbf{n}| |\mathbf{h}|} \right)^s * \mathbf{c}_s * \mathbf{l}_s$$

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Shininess

- ⇒ What is the magic  $s$  in the exponent of both equations?

$$\mathbf{r} = \frac{2(\mathbf{n} \cdot \mathbf{l})}{|\mathbf{n}| |\mathbf{l}|} \mathbf{n} - \mathbf{l}$$

$$\mathbf{i}_s = \left( \frac{\mathbf{r} \cdot \mathbf{v}}{|\mathbf{r}| |\mathbf{v}|} \right)^s * \mathbf{c}_s * \mathbf{l}_s$$

$$\mathbf{h} = \mathbf{l} + \mathbf{v}$$

$$\mathbf{i}_s = \left( \frac{\mathbf{n} \cdot \mathbf{h}}{|\mathbf{n}| |\mathbf{h}|} \right)^s * \mathbf{c}_s * \mathbf{l}_s$$

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Shininess

➤ What is the magic  $s$  in the exponent of both equations?

- Controls the “size” of the specular highlight
- As  $s$  increases, the highlight gets smaller
- The dot-product is always less than 1.0, so raising it to some power makes it smaller faster.

$$\mathbf{r} = \frac{2(\mathbf{n} \cdot \mathbf{l})}{|\mathbf{n}| |\mathbf{l}|} \mathbf{n} - \mathbf{l}$$

$$\mathbf{i}_s = \left( \frac{\mathbf{r} \cdot \mathbf{v}}{|\mathbf{r}| |\mathbf{v}|} \right)^s * \mathbf{c}_s * \mathbf{l}_s$$

$$\mathbf{h} = \mathbf{l} + \mathbf{v}$$

$$\mathbf{i}_s = \left( \frac{\mathbf{n} \cdot \mathbf{h}}{|\mathbf{n}| |\mathbf{h}|} \right)^s * \mathbf{c}_s * \mathbf{l}_s$$

# *Blinn-Phong vs. Phong*

- The Blinn-Phong equation is an approximation of the Phong equation
  - Yes... an approximation of an approximation

$$(\mathbf{r} \cdot \mathbf{v})^s \approx (\mathbf{n} \cdot \mathbf{h})^{4s}$$

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Ambient

- The lighting model so far is a purely *direct lighting* model
  - Most real world light bounces off of other objects, and is call *indirect lighting*
  - We can account for the background, indirect light by adding a simple ambient component

$$\mathbf{i}_a = \mathbf{c}_a * \mathbf{l}_a$$

- *This is the biggest hack of all!*

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# *Shading Models*

- ⇒ We know how to calculate lighting values, but the question remains: how often do we calculate it?

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Flat Shading

- Simplest answer: calculate lighting once per polygon
  - Fast!
  - Depending on the circumstances, the quality may be good enough...but usually not

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# *Gouraud Shading*

- Calculate lighting once per vertex, interpolate colors across polygon
  - A little slower: more math, have to do interpolation

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Gouraud Shading

- Calculate lighting once per vertex, interpolate colors across polygon
  - A little slower: more math, have to do interpolation

For all intents and purposes, this is free.

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Gouraud Shading

- Calculate lighting once per vertex, interpolate colors across polygon
  - A little slower: more math, have to do interpolation
  - Looks better
  - Works well for diffuse, but works poorly for specular

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Gouraud Shading

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Gouraud Shading

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Phong Shading

- Next logical step: interpolate lighting parameters, calculate lighting per pixel
  - Looks much better...doesn't miss the specular highlight!
  - Much more expensive to calculate
    - Has really only been practical for real-time rendering for the last couple years
    - Not only requires the lighting to be recalculated per pixel, but interpolated vectors may need to be re-normalized per pixel

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Phong Shading

# *Types of Lights*

- Several common types of lights used in graphics:
  - Point light
  - Directional light
    - Also called infinite light
  - Area lights
  - Spot lights

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Point Lights

- Calculate the  $\mathbf{l}$  vector by subtracting the vertex position from the light position and normalize the result

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Point Lights

- Calculate the  $\mathbf{l}$  vector by subtracting the vertex position from the light position and normalize the result

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Point Lights

- Calculate the  $\mathbf{l}$  vector by subtracting the vertex position from the light position and normalize the result

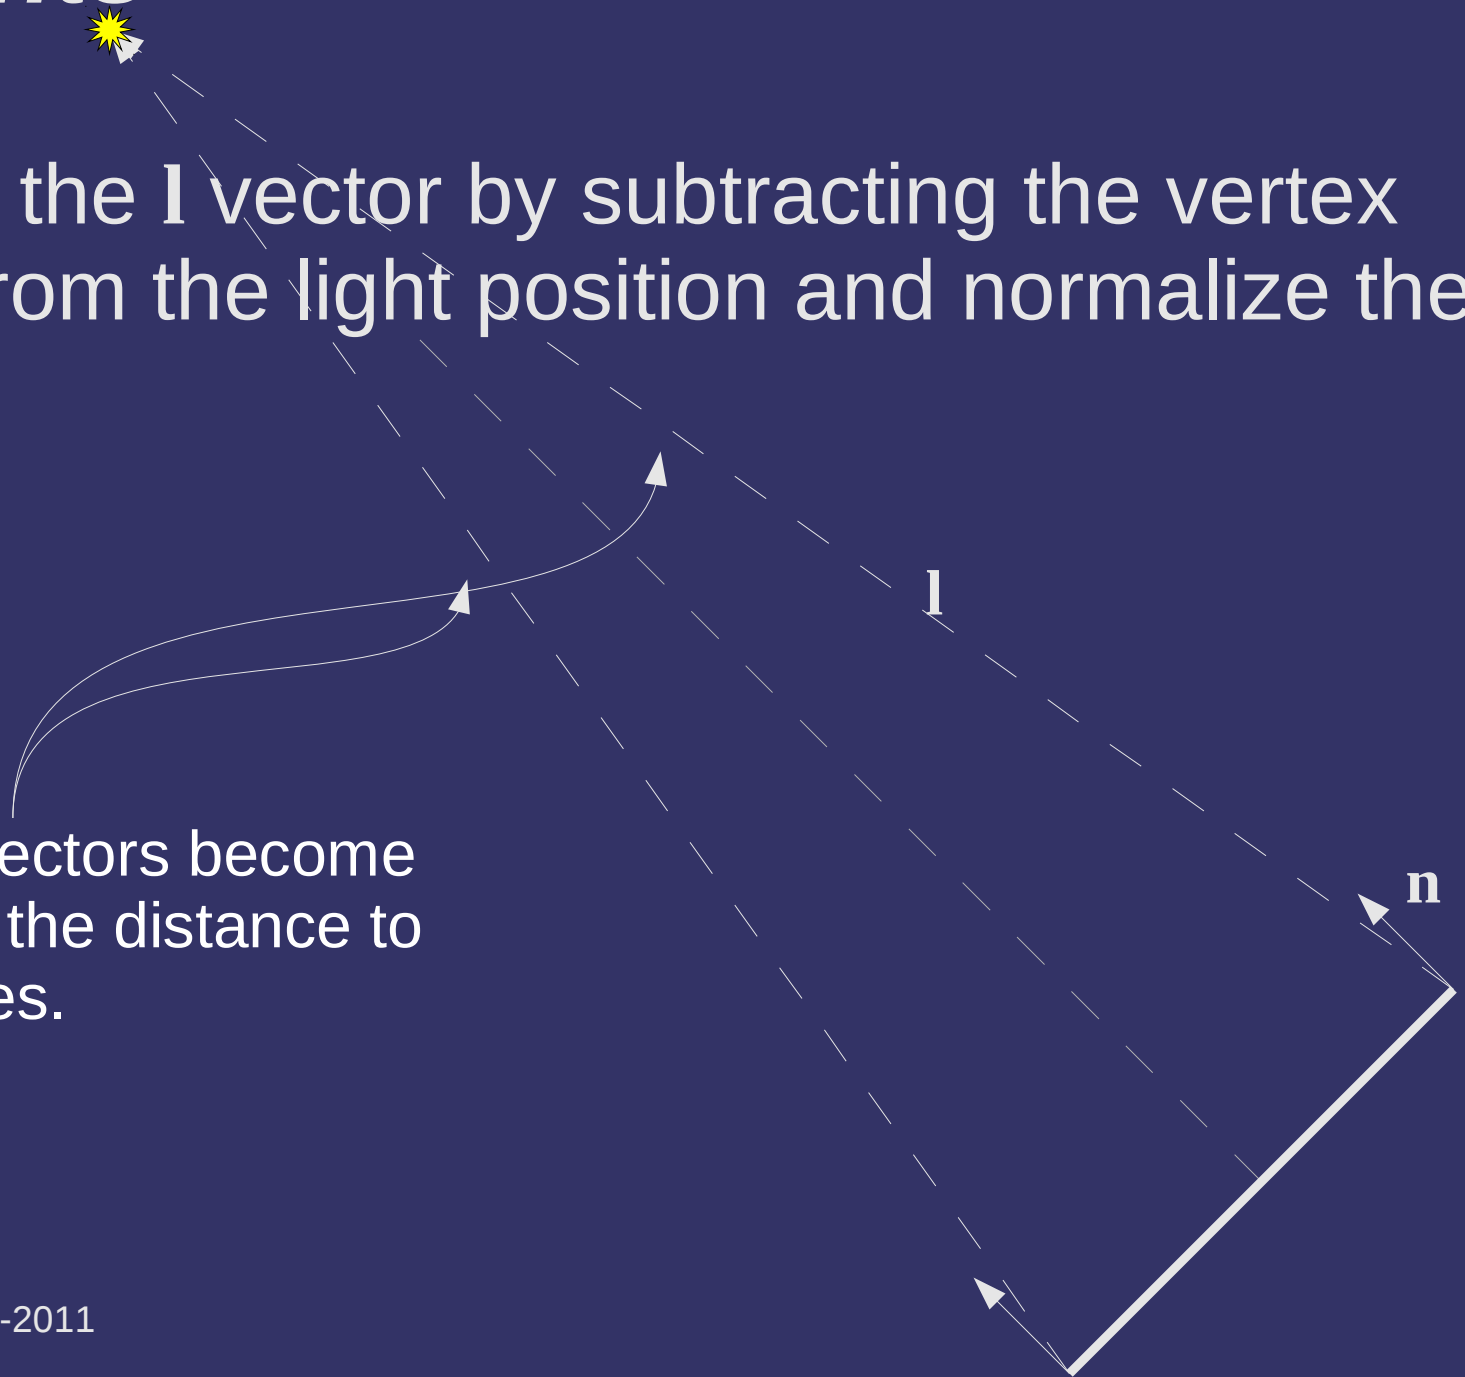

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Point Lights

- Calculate the  $\mathbf{l}$  vector by subtracting the vertex position from the light position and normalize the result

Note how the  $\mathbf{l}$  vectors become more parallel as the distance to the light increases.

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Directional Lights

- For lights at infinity, all  $\mathbf{l}$  vectors are parallel
  - Simplify the math, treat the light as *just* a direction
  - Direction doesn't change → don't to interpolate it!
  - Still have to transform it into the space where lighting is calculated

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Area Lights

- Both models treat lights as infinitesimal points
  - All real lights have some surface area
  - Lights with larger surface areas are considered “softer”
    - This results in shadows with smoother boundaries
    - This is why we have frosted light bulbs and lamp shades instead of bare, clear glass bulbs
  - Techniques exist for handling these sorts of lights, but they are expensive and (currently) impractical for most real-time use
    - We'll discuss this more next term

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Spot Light

- Most lights don't emit light in all directions
  - Some range over which the light intensity is 100%
  - Some range over which the light intensity gradually decreases
    - This range may be zero
  - Remaining range where no light is emitted

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Spot Light

Full intensity light

No light

Partial intensity light

Image, by *satanoid*, from <http://www.everystockphoto.com/photo.php?imageId=673587>

2-November-2011

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Spot Light

- Need additional light parameters:
  - $\mathbf{l}_{dir}$  – direction the light is pointing
  - $l_{cut}$  – Absolute cut-off angle
  - $l_{exp}$  – Exponent for cut-off equation

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Spot Light

$$\mathbf{i} = \begin{cases} (\mathbf{l}_{\text{dir}} \cdot -\mathbf{l})^{l_{\text{exp}}} * \mathbf{i}_L & \text{if } (\mathbf{l}_{\text{dir}} \cdot -\mathbf{l}) > \cos(l_{\text{cut}}) \\ 0 & \text{otherwise} \end{cases}$$

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Distance Attenuation

- The farther a light is from an object, the less light gets to that object
  - Three separate factors control the attenuation
  - $k_c$  – constant attenuation factor
  - $k_l$  – Linear attenuation factor
  - $k_q$  – Quadratic attenuation factor

$$d = |\mathbf{l}|$$
$$a = \frac{1}{k_c + k_l d + k_q d^2}$$

2-November-2011

© Copyright Ian D. Romanick 2009 - 2011

# Next week...

## ⇒ Bounding volumes

- Bounding spheres
- Axis-aligned bounding boxes (AABBs)
- Oriented bounding boxes (OBBs)
- Hierarchies of BVs

## ⇒ More occlusion

- Hierarchical frustum culling

2-November-2011
