GSoC project: Improving RTF Export Presentation of a GoOO student

Miklos Vajna

22 October 2010

Introduction

- Background
- Activities in GoOO before SoC
- Project this summer: development of a new RTF export filter
 - developer side
 - user side

Background

- I'm a student from Budapest University of Technology and Economics, Hungary
- A few project I am interested in:
 - Frugalware Linux a distribution
 - BitlBee an IM to IRC gateway (Skype module)
 - git I wrote the current git-merge command
 - swig the binding generator (PHP director support)
 - LibreOffice packaging, RTF export filter

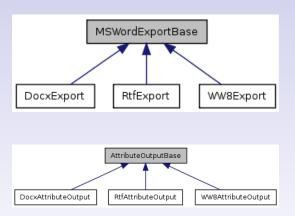

Activities in GoOO before SoC

- Packager for Frugalware Linux
- Minor build system fixes
 - trivial support for newer gcj versions
 - git-related patches
- No C++ coding (steep learning curve)

RTF Export Development Summary

- idea: the concept of RTF is very similar to doc/docx (Microsoft invented them), just with a different markup
- Novell already created MSWordExportBase
- target: to support everything which was provided by the old filter, smaller size, new features

The common base

- MSWordExportBase: tries to map Writer concepts to MSO
- AttributeOutputBase: 120+ methods for different resources

RTF Export Development Other new classes

- RtfExportFilter: glue between RtfExport and UNO
- RtfImportFilter: glue between the old RTF import and UNO
- RtfSdrExport: handles drawings
- RtfFilter in writerfilter: calls RtfExportFilter and RtfImportFilter via UNO

Is the goal reached?

- No regressions compared to the old filter: mostly
 still needs more testing, but it's enabled by default
- 0 "
- Smaller code:

```
47 files changed
7567 insertions(+), 6981 deletions(-)
More code - due to better structured code, new features.
```

 More features: far from lossless conversion, but a number of new features

- German comments
- No test files for the old filter
- Can't wait for the moment when split build will be recommended for development
- Non-intuitive API's

Hard to remember API's

To send over an SvStream through UNO:

```
utl::OStreamWrapper() to wrap it,
utl::UcbStreamHelper::CreateStream() to unwrap
```

 No common base for header / footer - duplicated IsActive() method:

```
class SW_DLLPUBLIC SwFmtHeader: public
    SfxPoolItem, public SwClient {...}
class SW_DLLPUBLIC SwFmtFooter: public
    SfxPoolItem, public SwClient {...}
```

- Getting the streams from a media descriptor:
 - MediaDescriptor::PROP_STREAMFOROUTPUT() output
 - MediaDescriptor::PROP_INPUTSTREAM() input

Additional tools

- fromhex.py reads a hexdump from RTF and writes it as a binary
- prettyprint.py pretty-prints an RTF file
- oodocdiff.sh to test
 - sadly it's mostly useless due to character kerning and other changes

RTF Export Development Testing

- Cloned ooo-test-files from Cedric / Kohei
- Added 25 test ODT files
- Tested with headless writer + jodconverter using UNO
 - that can be now replaced with the batch conversion patches

- Chicken and egg problem: pointless to read specs from start to end, but how to just use it as a reference?
- Necessary resources:
 - Rich Text Format (RTF) Specification, version 1.9.1 (Word 2007)
 - Object Linking and Embedding (OLE) Data Structures
 - ISO/IEC 29500-1:2008 OOXML spec
 - Word Binary File Format (.doc) Structure Specification
