

# The free software desktop's graphics driver stack.

Luc Verhaegen <[libv@skynet.be](mailto:libv@skynet.be)>

FOSDEM2010 X.org DevRoom.

2010-02-07

# Modular good!

- Xfree86 driver SDK installed per default.
- Autotools.
- Clearer structure.
- Individual parts are more accessible.

# Modular bad!

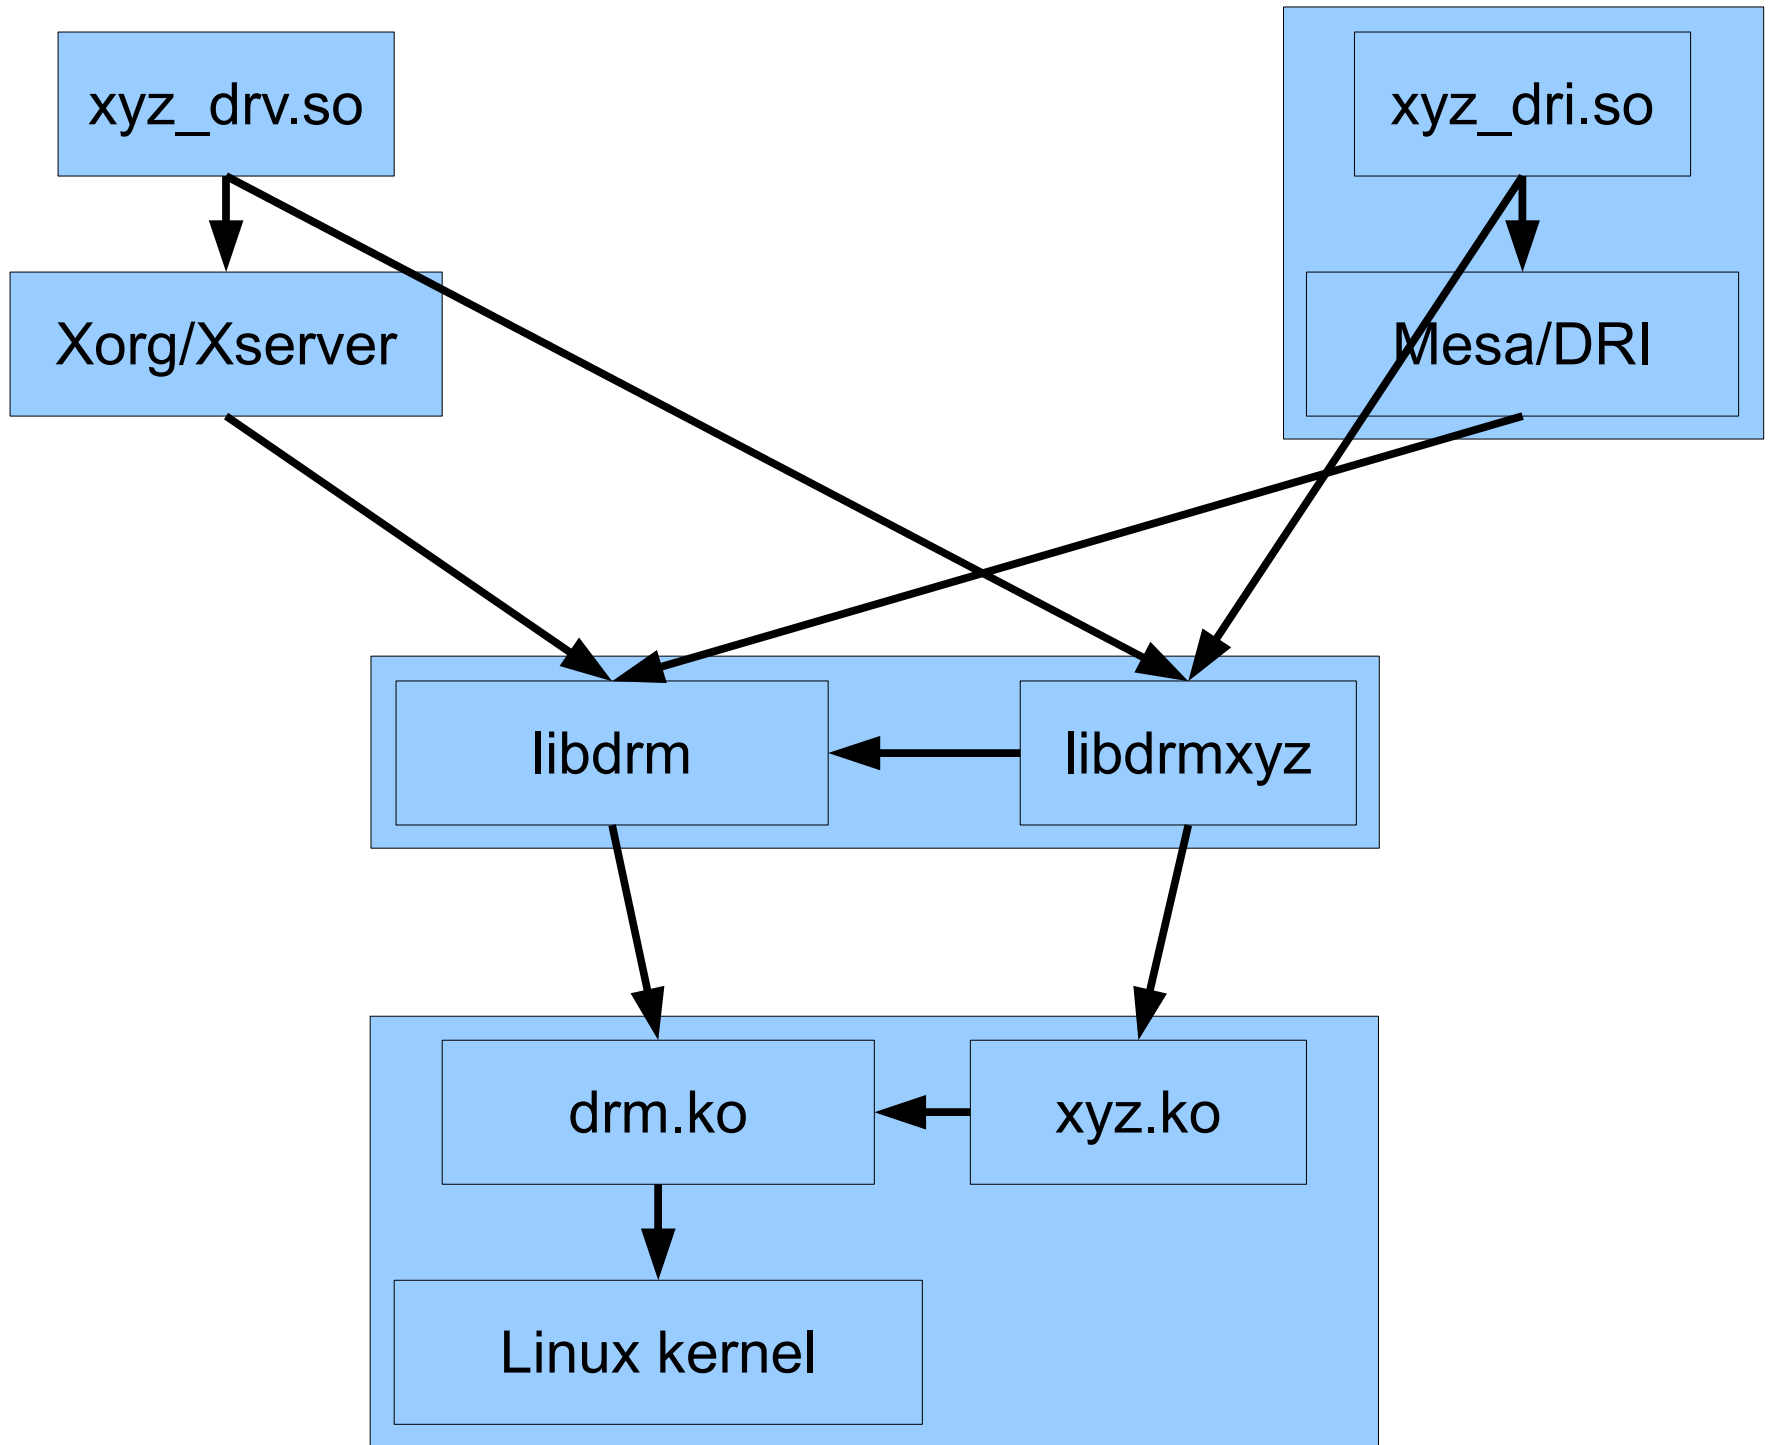

- X went from highly stable to highly volatile.
- Vendors still patch their trees.
- Everything is dispersed.
- No-one builds the whole of X anymore.
- Who still tests anything today?
- Only X.

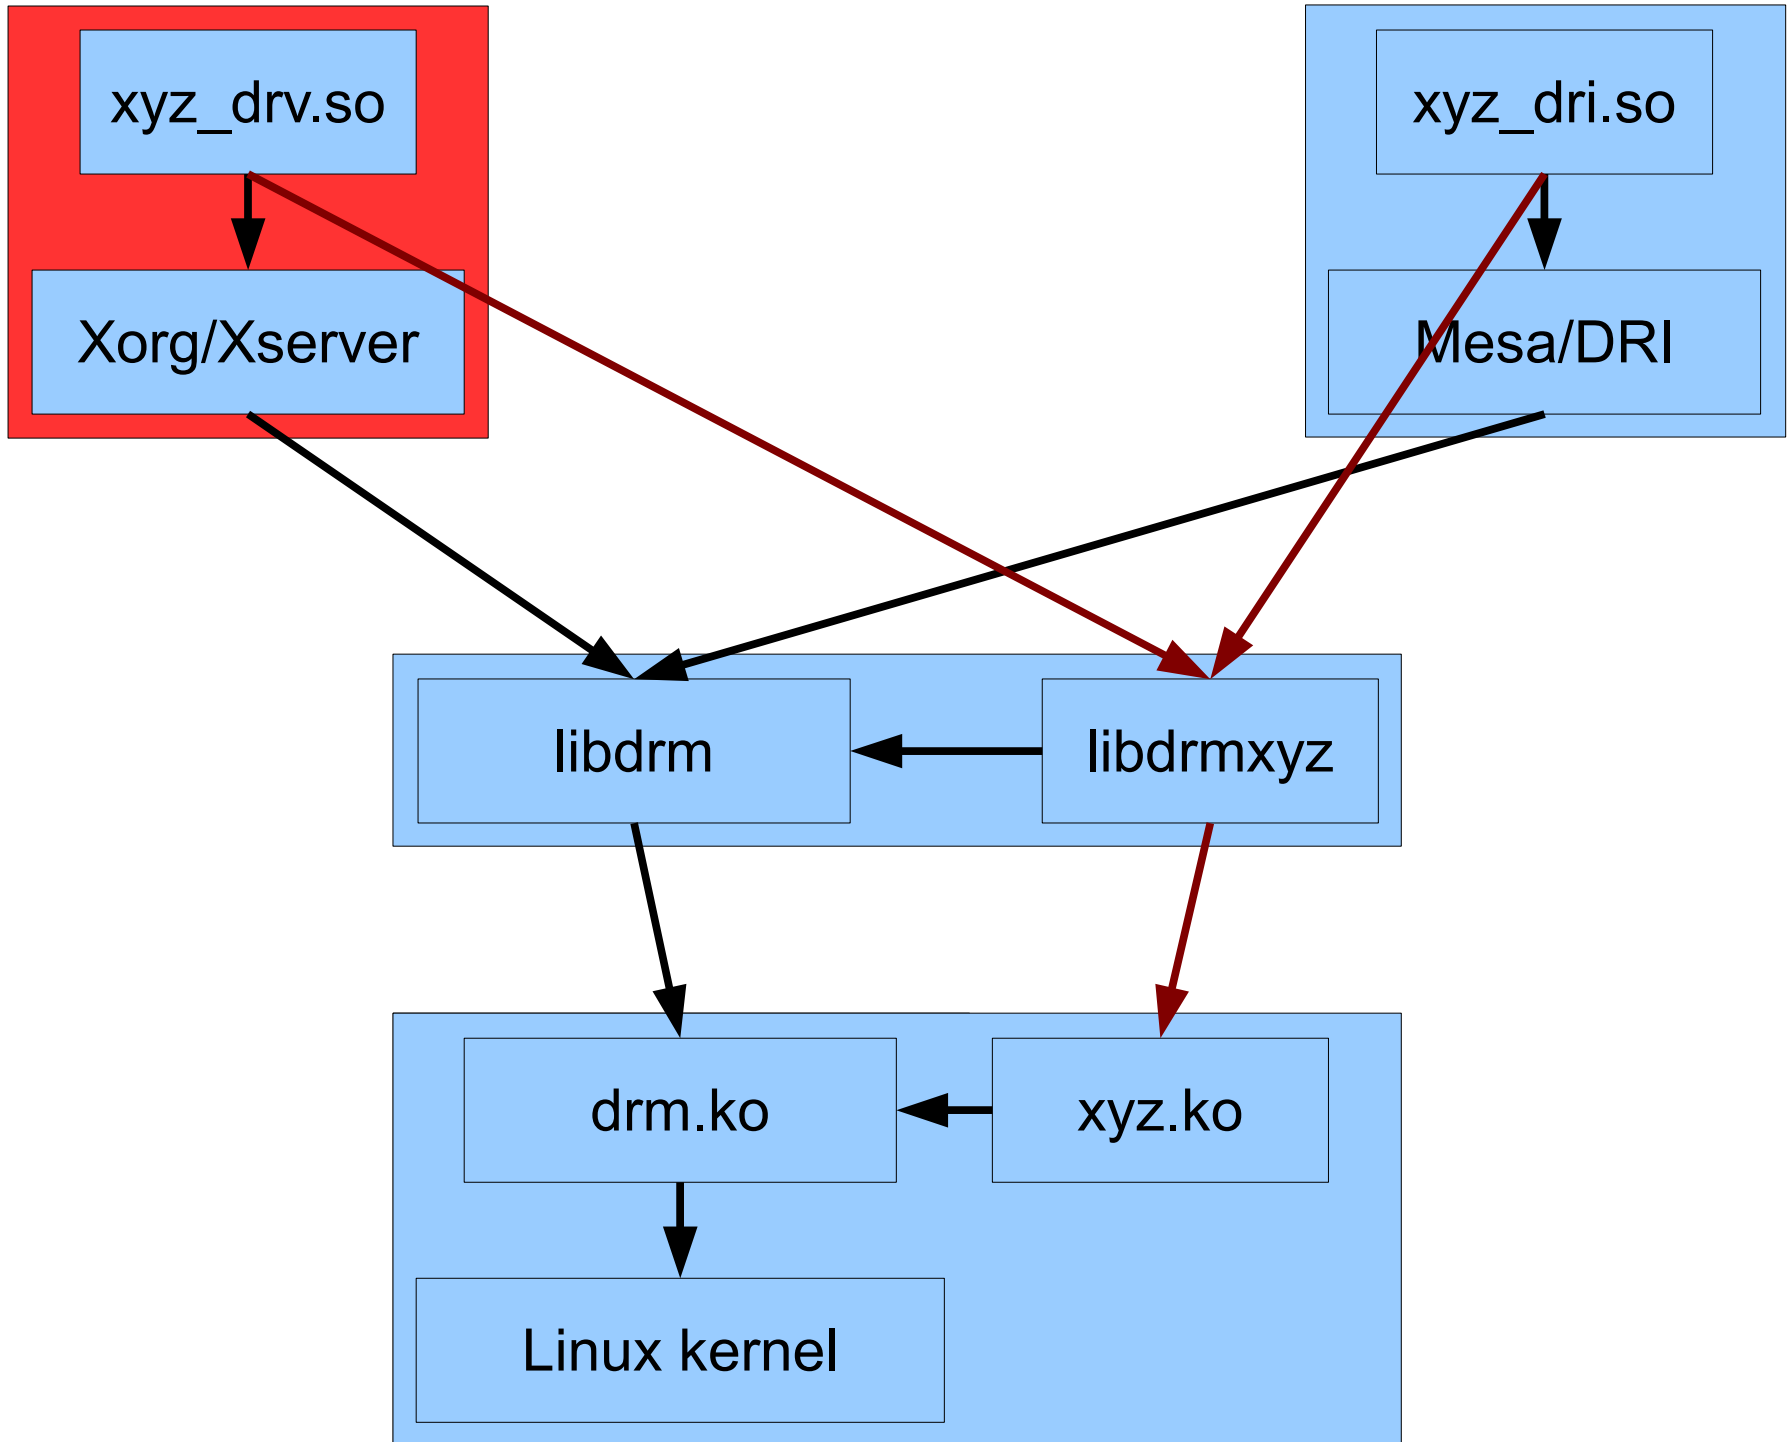

The graphics driver problem.

**Survey Time!**

# Requirements

- Hardware vendors.
- Distributors.
- Users.
- Developers?

Linux kernel

# Unichrome

■ Debian oldstable (etch)

■ Debian stable (lenny)

■ Debian testing (squeeze)

■ OpenSUSE 11.1

# Unified building – X driver

- Needs xf86 SDK.
- Autotooled since modular X.
- Familiar process by now ;)

# Unified building – linux/drm

- Needs linux kbuild and headers packages.
- Autotools integrated Kbuild.
- Easy!

# Unified building – Mesa/DRI

- Needs especially prepared mesa tree. :(
  - `./configure`
  - `cd src/mesa/`
  - `make libmesa.a`
- Autotools integration:  
`./configure --with-mesa-dir=<DIR>`
- Icky, but not hard.

# TODO

- Everyone needs to start doing unified trees!
- Care needs to be taken in APIs...
- ... which will happen naturally.

# TODO: kernel/drm

- Just organisation/repository changes.
- Longer term: Segregate HW init, modesetting, memory management and drm parts.

# TODO: libdrm

- Move out driver specific parts NOW!
- Driver headers and register definitions are not libc headers!
- Again, modesetting, memory management and standard libdrm are separate. Split there!

# TODO: Mesa

- Modularize!
- Provide shared libraries: libmesabase  
libmesadri, libmesagallium, libmesadricommon
- Formalize APIs for these libraries.
- Add pkgconfig and packaging.
